Abstract

The AI-Based Adaptive Customer Support Chatbot is designed to provide fast, accurate, and personalized assistance to customers. The system uses Natural Language Processing (NLP) and Machine Learning to understand user queries, identify their intent, and generate suitable responses. Unlike traditional rule-based chatbots, the proposed chatbot adapts and improves its responses by learning from previous conversations, customer feedback, and frequently asked questions.

The chatbot can answer common questions, provide product or service information, track customer complaints, and transfer complex queries to a human support agent. It is available 24/7, which reduces customer waiting time and the workload of support teams. The system can be developed using Python, NLP libraries, a machine-learning model, and a database for storing conversations and customer information.

The main objective of this project is to improve customer satisfaction by providing an intelligent, scalable, and cost-effective support system. The proposed chatbot can be used in e-commerce, banking, healthcare, education, telecommunications, and other customer-service sectors. Overall, the project demonstrates how artificial intelligence can make customer support faster, smarter, and more personalized.
